## Boom and Fixed Jib

1. Rated loads included in the charts are the maximum allowable freely suspended loads at a given boom length, boom angle and load radius, and have been determined for the machine standing level on firm supporting surface under ideal operating conditions. The user must limit or derate rated loads to allow for adverse conditions (such as soft or uneven ground, out-of-level conditions, wind, side loads, pendulum action, jerking or sudden stopping of loads, inexperience of personnel, multiple machine lifts, and traveling with a load).
2. Rated loads do not exceed 75% of minimum tipping loads. Rated loads based on factors other than machine stability such as structural competence are shown by asterisk \* in the charts.
3. The machine must be reeved and set-up as stated in the operation manual and all the instruction manuals if these manuals are missing, obtain replacements.
  - Boom backstops are required for all boom lengths.
  - The crane must be leveled to within 1% on a firm supporting surface.
  - Counterweights and carbody weights are installed according to the instruction.
4. Do not attempt to lift where no ratings are shown as crane may tip or collapse.
5. Attempting to lift more than rated loads may cause machine to tip or collapse. Do not tip machine to determine capacity.
6. Weight of hooks, hook blocks, slings and other lifting devices are a part of the total load. Their total weight must be sub-tracted from the rated load to obtain the weight that can be lifted.
7. When lifting at boom point with jib or auxiliary sheave, rated loads for the boom must be deducted as shown below.
8. The total load that can be lifted over an auxiliary sheave is the value for 1,500 lbs deducted from rated load for the boom without auxiliary sheave, but it should not exceed auxiliary maximum hoist loads.
9. The total load that can be lifted at a jib is limited by rated jib loads.
10. Boom lengths that can attach auxiliary sheave are from 78 ft (24 m) to 276 ft (84 m).
11. Boom lengths for jib mounting are 98 ft (30 m) to 256 ft (78 m).
12. 40 ft (12.2 m) jib length with offset angle 10 degrees, one part of line on hook is not allowed to use.
13. The boom should be erected over the front of the crawlers, not laterally. When erecting and lowering the luffing boom at length of 256 ft (78 m) or over, the pillow plates for erection must be placed at the end of the crawlers.
14. The minimum rated load is as shown below

Crane boom	9,700 lbs (4.4 t)

### Luffing Jib

1. Rated loads included in the charts are the maximum allowable freely suspended loads at a given boom length, boom angle and load radius, and have been determined for the machine standing level on firm supporting surface under ideal operating conditions. The user must limit or derate rated loads to allow for adverse conditions (such as soft or uneven ground, out-of-level conditions, wind, side loads, pendulum action, jerking or sudden stopping of loads, inexperience of personnel, multiple machine lifts, and traveling with a load).
2. Rated loads do not exceed 75% of minimum tipping loads. Rated loads based on factors other than machine stability such as structural competence are shown by asterisk \* in the charts.
3. The machine must be reeved and set-up as stated in the operation manual and all the instruction manuals if these manuals are missing, obtain replacements.
  - Boom backstops are required for all boom lengths.
  - The crane must be leveled to within 1% on a firm supporting surface.
4. Do not attempt to lift where no ratings are shown as crane may tip or collapse.
5. Attempting to lift more than rated loads may cause machine to tip or collapse. Do not tip machine to determine capacity.
6. Weight of hooks, hook blocks, slings and other lifting devices are a part of the total load. Their total weight must be subtracted from the rated load to obtain the weight that can be lifted.
7. The total load that can be lifted of a jib is limited by rated jib loads.
8. The total load that can be lifted of an auxiliary sheave should not exceed 33,000 lbs in case of single part of line. And it should not exceed 66,100 lbs in case of two parts of line.

9. Luffing boom and jib combinations.

○ : Combinations which is allowed.

10. The boom should be erected over the front of the crawlers, not laterally. When erecting and lowering for all boom and jib combinations, the blocks for erection must be placed at the end of the crawlers.
11. Least stable position is over the side.
12. The minimum rated load is 9,700 lbs (4.4 t).

## Luffing Jib

16. Hook block and number of reeving parts of line restriction.
  - (1) The self-weight of luffing jib point hook block must be heavier than or equal to the table below.
  - (2) Total number of reeving parts of line on luffing jib point hook block must be larger than or equal to the table below.

**⚠ DANGER**

Follow the both (1) and (2) above at a same time for the luffing jib operation. Otherwise luffing jib may tip over the backwards due to lack of weight on front side of boom. Failure to observe this precaution may lead to the jib tipping backwards and resulted to machine collapsing.
